

## **Proposal for Hyperlocal Business Directory Data Acquisition (Australia)**

Hi ma'am,

Thank you for sharing the requirement. I understand that the goal is to build a **high-quality hyperlocal business directory for Australia**, launched state-wise, with more complete and reliable business data than standard directories.

### **Project Objective**

Create a **structured, scalable business listing database** that enables users to search local businesses (e.g., plumbers, electricians, butchers, etc.) by **category + suburb/city + state**.

---

### **Core Data Fields**

- 🕒 Business Name, Category / Industry, Address / Suburb / State / Postcode, Contact Number, Website / Email (if public), Business profile / map links

### **Recommended Execution Approach**

Rather than treating this as only a scraping task, I would approach it as a **multi-source business data acquisition, validation, and directory preparation workflow** focused on:

- 🕒 **Data completeness**
- 🕒 **Record accuracy**
- 🕒 **Deduplication**
- 🕒 **Consistent structuring**
- 🕒 **Scalable rollout across states and categories**

### **Phase 1 – Pilot (Recommended)**

To ensure quality and establish the right workflow, I recommend starting with:

- 🕒 **1 Australian state**
- 🕒 **1–2 business categories**
- 🕒 Multi-source data collection
- 🕒 Data validation and deduplication
- 🕒 Delivery in **Excel / CSV / Google Sheets** format

This pilot will help validate source quality, finalize the data schema, and create a repeatable process before state-wise expansion.

### **Proposed Workflow**

1. Define pilot scope (state, categories, required fields)
2. Identify relevant public/compliant business data sources
3. Collect records using structured Python-based automation
4. Clean, standardize, validate, and deduplicate records
5. Deliver a directory-ready dataset
6. Scale state-wise after pilot approval

### **Tools & Technology**

- **Python**
- **Scrapy / BeautifulSoup / lxml**
- **Playwright / Selenium** (for dynamic sites)
- **Pandas** (data cleaning & structuring)
- **RapidFuzz / fuzzy matching** (deduplication)

- **OpenAI / GPT-based structured extraction** for inconsistent website layouts, field normalization, and category mapping

#### **Deliverables**

- Clean and structured business listing dataset
- Validated and deduplicated records
- Spreadsheet / database-ready output
- Source mapping for transparency
- Pilot recommendations for scalable rollout

#### **Recommended Next Step**

I recommend starting with a **pilot phase** to validate data quality, finalize the workflow, and build a scalable foundation for broader rollout across Australia.

**Best regards,**  
**Anushka Polley**
